Chip PC Technologies - Making IT a Complete Solution

Box Content

Unpack and identify the following parts:

• Jack PC device

• Lower Cardboard Template that can be used for marking wall cutout in New Installation

• Metal Housing for Jack PC

• IDC Krone Termination Connector Block

• RJ-45 Termination Connector Block (Order separately)

• Extraction Tool to remove device after it was installed (optional)

Existing Jack Installation

Tools you will need:

- Power-over-Ethernet Tester • Screwdriver/Electric screwdriver
- RJ-45 Termination Connector Block - to be purchased separately from Chip PC • Half-round File to trim wall cutout
- Cloth to clean Housing contacts • Extraction Tool to remove device after it was installed

Use Power-over-Ethernet tester to check existence of PoE in the Jack designated for installation.
Note: In case there is no PoE available, Jack PC can be powered by External power supply (see step 13).

Remove the existing LAN Jack from the wall. Separate the LAN Jack module from the front panel.

Pull out the LAN cable. Take the RJ-45 Termination Connector Block, which is not supplied in default packaging and needs to be purchased separately.

Connect the LAN jack and RJ-45 connector on the RJ-45 Termination Connector Block.

Insert the RJ-45 Termination Connector Block into the Housing bottom part until you hear a clicking sound indicating it has locked properly into place.

Place Housing inside the wall cutout. Trim wall cutout if necessary.

New Installation

Tools you will need:

- Drill with 65 mm (2.6 Inch) Hole Saw • Half-round File to trim wall cutout
- Cutter to remove LAN cable insulation • IDC Krone punch-down tool to secure wires • Cloth to clean Housing contacts
- Screwdriver/Electric screwdriver • Extraction Tool to remove device after it was installed

Use the lower Cardboard template supplied in packaging to mark the designated wall cutout for the Housing installation.

Drill the wall cut out at the designated location.
Warning! Make sure not to drill next to electricity / telephone lines. Test for existence of power lines or enforcement beams prior to drilling the wall cutout.

Trim the cutout gently and check that the Housing fits in properly.

Pull out the LAN cable and remove 4cm/1.5 inch of its plastic insulation. Separate wire pairs by color.

Open the IDC Block red cover. Secure the wires with an IDC Krone tool, using the appropriate color scheme TIA568 version A or B (Pic. "A"; "B"). When using a shielded LAN cable, wrap the Shield wire around the metal Tab (pic. "C")

Close the IDC Krone Termination Connector Block and insert it into the Housing bottom part until you hear a clicking sound indicating it has locked properly into place.

Make sure that the Housing is fully inserted, level-headed and Housing contacts are located at the bottom part as shown in picture. Secure with 4 screws.

Gently clean the Housing contacts from dust and other objects.

The Jack PC device should be inserted with contacts shown in picture facing downwards enabling direct contact with the Housing contacts.

Insert the Jack PC device into the Housing until you hear a clicking sound indicating the device has locked properly into place. Insert additional 2 screws to the frame and tighten.

Note: In case you need to remove device after it was installed, remove the 2 screws from frame and unlock device using the Extraction Tool turned clockwise.

Connect Keyboard, Mouse, Monitor and any other required peripheral to device ports.

Some models offer dual-screen support. In order to get this functionality, connect Y-cable to the DVI monitor port. The Y-cable is to be purchased separately as accessory from Chip PC.

To power the device from an external power source, connect Chip PC-supplied power supply to the DC power jack. The power supply is to be purchased separately as accessory from Chip PC.
